ESOT SURVEY ON CMV MANAGEMENT IN THE SOLID ORGAN TRANSPLANT RECIPIENT PATIENT POPULATION

CMV infection remains one of the major complications following solid organ transplantation with significant impact on patient and graft survival, however the strategies to diagnose and prevent this infection are quite heterogeneous in the different centers throughout Europe.

The European Society for Organ Transplantation (ESOT) with the support of Merck invites you to fill in a survey on CMV infections in solid organ transplantation. The purpose of this survey is to verify the strategies used to diagnose, prevent and treat CMV infection in European centers, according to country, type of organ, Donor/Recipient match and immunosuppressive regimens. In addition, monitoring of CMV-specific T cell immunity is becoming a relevant tool to personalize preventive strategies and therefore some questions of the survey are directed to understand the current practice in the European transplant centers.

The survey will take about 20 minutes to be completed, and to thank every user who provides all answers, ESOT will provide a coupon code to access their e-learning platform, Transplant Live, for free for 1 year.

Thank you in advance for taking time to contribute to this important study.
To start the survey, click [HERE](#)

Survey will remain open until 30 September 2019.
For any questions contact ESOT directly: membership@esot.org
